TITLE: Measurement of astronomical distances, I (first of a series of articles)

SOURCE: Fizikai szemle, no. 5, 1964, 155-158

TOPIC TAGS: astronomical distance measurement, astronomical unit, trigonometric, secular, star-streaming, dynamic, rotational parallax, Au

ABSTRACT: After a very brief history of astronomical measurements since Aristarchus, the two authors give the latest value of the "astronomical unit" (mean distance between earth and sun) as 149.6 ± 0.03 million km, and discuss rather briefly trigonometric, secular (or statistical), star-streaming, dynamic and rotational parallax, summarizing the studies, methods and theories on these subject, apparently without making any original contribution. Orig. art. has: 1 table, 5 figures and 7 formulas.

 Effects of silicon and iron impurities upon the properties
 of Al-Mg3 alloy. *Laszlo Fodor, Rensó Herendi, Ottó*
~~Selinger, and Márton Kóssó. *Rohászati Lapok* 91, 135-9~~
 (1948).—Contaminant traces will not affect hardenability
 but will cause an increase in hardness. The Si content will
 dissolve over 350° and will segregate upon cooling as Mg₂Si
 or FeSiAl₃. Annealability is improved with Fe and Si if
 either or both are of low concn. If both are of high concn,
 FeSiAl₃ (a very hard phase) will form. Recrystn. is affected
 by Fe and Si in that these contaminants will retard the
 growth of the crystallites. The recrystn. threshold is 10-15%
 reduction at 300° and <10% at 500°. L. G. Arvai

"Industrial Digitalis Intoxication."

Budapest, Orvosi Hetilap, Vol 107, No 36, 4 Sep 66, pages 1704-1707.

Abstract: [Authors' Hungarian summary] A case of industrial digitalis intoxication is reported. Similar reports could not be found in the literature. The patient never received digitalis as medication. Her complaints, determination of the digitalis glycoside content of the vomitus and the constantly changing EKG were characteristic of digitalis intoxication - the hyperglycemia, glycosuria and leukocytosis were also indicative of toxic damage. The industrial nature of the poisoning was confirmed by the work-history of the patient and by the demonstration of digitalis-glycoside impurities in the air of the room. In conclusion, the problems of prevention are discussed. 7 Hungarian, 17 Western references.

"Correlation Between Phage-Type Coagulase, Hyaluronidase and Phosphatase Activity, and Mercuric Chloride Resistance of Staphylococcus Aureus."

Budapest, Acta Microbiologica Academiae Scientiarum Hungaricae, Vol X, No 1, 1963, pages 19-25.

Abstract: [English article, authors' English summary] Phage group I Staphylococcus aureus strains (especially phage type 80/81) exert a low coagulase and hyaluronidase but high phosphatase activity. Strains belonging to phage group II show a high coagulase and hyaluronidase and a medium phosphatase activity. Phage group III strains produce small amounts of phosphatase; their hyaluronidase and coagulase activity is of medium degree. Most of the "epidemic" strains are resistant to mercuric chloride. The resistance is not associated with the increased production of any of the enzymes examined. 4 Hungarian, 16 Western references.

TITLE: Studies of Staphylococcus aureus L forms blocked at different stages of cell wall synthesis
SOURCE: Academia scientiarum hungaricae. Acta microbiologica, v. 12, no. 2, 1965, 173-179

TOPIC TAGS: biosynthesis, bacteria, bacteriology, penicillin

ABSTRACT: 1) Four different L strains, which were growing well in liquid medium, have been obtained from Staphylococcus aureus strain 100 by means of penicillin treatment. 2) In the presence of penicillin, two of the L cultures produced about 5 times more acid soluble acetylamino sugar-containing nucleotides than did the others. 3) The accumulated nucleotides were identified as uridine diphosphate-muramic acid peptides. 4) When penicillin was omitted from the medium, the Park nucleotide production by the stable L form remained at the same level while its production by the two L strains, which produce this substance in large amounts in a penicillin-containing medium, decreased considerably. The authors thank Mr. J. Vasvary for skilled technical assistance. Orig. art. has: 1 figure and 3 tables.

Title : The Determination of Sulfur Content in Organic Compounds
in the Form of Sulfate by Way of Conductometric Titration.

Orig Pub: Acta Univ. Debrecen., 1956 (1957), 3, No 2, III-116.

Abstract: SO_4^{2-} is determined by conductometric titration at determination of S in organic compounds by Grothe's method (burning in the current of air or O_2 , the absorption of SO_2 and SO_3 by a 3% solution of H_2O_2 and the determination of the quantity of SO_4^{2-}). In addition to that, it is not necessary to disintegrate H_2O_2 . The equivalent point is found graphically in coordinates resistance - quantity

Abstract: and which interfere with its following determination. Ethylenedinitrilotetraacetic acid (I) is added (in a 1.5-fold excess with reference to the expected concentration of the salt) to the solution to be analyzed. At this occasion, the admixtures produce strong anion complexes with I, while U produces a very unstable complex with I under these conditions (pH about 7). The obtained solution is diluted with water and let through a column (1 cm in dia, length 10 cm) at the rate of 3 ml per min. The column contains cation-exchanging resin Amberlite IRC-50 in the H form (in order to convert the resin into the H form, it is treated preliminarily with 50 ml of 3 M H₂SO₄). At this occasion, the interfering elements pass

acc

In the course of an investigation on the methods of attacking uranium ores, such processing was found to be superior both from the technical and economical points of view when compared with the sulphuric acid method. Recovery by chemical precipitation of uranium from dilute process solutions is not economical. Three ion-exchange processes were examined for the concentration of the uranium contents

of the pulp: a column ion-exchange process for recovering uranium from carbonate solutions; an anion exchange process for the recovery of uranium from sulphuric acid solutions; and the ion-exchange of uranium solutions in fluidized bed. The latter method has the advantage that the costly process of filtration can be eliminated, but its disadvantage is that after the recovery of the metal contents the pulp which contains valuable elements (sulfate) must be purified before recycling.

AUTHORS: Fodor, M., Szabó, E., Pokó, Z.

TITLE: Investigation of the properties of ion exchange resins used for the extraction of uranium at various temperatures

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 17, 1962, 82, abstract 17B571 (Acta chim. Acad. scient. hung., v. 29, no. 1, 1961, 1 - 9 [Eng.; summaries in Ger. and Russ.])

TEXT: The changes in the properties of an ion exchange resins Mycion PA (My) and Amberlite IRA-400 (Am) were studied with variation of temperature from 20 to 90°C and as a function of the number of extraction cycles. The maximum increase in capacity at 80°C is 24.9% that observed at 20°C in the first cycle for My, and 13.1% for Am. After 50 cycles the reduction in capacity in the aforesaid temperature range and the deterioration in the mechanical strength (at 90°C) occur to a lesser degree for Am than for My. The yield (elution) curves obtained at 20, 40, 60 and 80°C are identical for both types of resin. [Abstracter's note: Complete translation.]

TITLE: Application of ion exchanges resins to the extraction of uranium. I Preliminary studies of the recovery of uranium by ion exchange methods

PERIODICAL: Magyar kémiai folyóirat, ¹⁸no. 6, 1962, 262 - 268

TEXT: The chemical and physical properties of quaternary ammonium type ion exchange resins prepared at the Műanyagipari Kutató Intézet (Research Institute of the Plastics Industry) and the technology of uranium extraction from dilute alkaline leaching solutions were studied. The particle size and shape, weight per liter of the swollen and dry resin and densities in water and benzene were determined. The total chloride capacity was determined from titration curves, on a resin with a particle size of 0.32 - 0.63 mm. The chloride capacities of the Mykion PA type resins were in the range of 1.02 - 1.38 when swollen and 2.67 - 3.45 mole equivalent g when dry. These data are compared with those of similar types of resins marketed in the West as Lewatite MN and Amberlite IRA-400. Breakthrough and sa-
Card 1/2

turation capacities for the complex uranyl tricarbonate anions were determined, and the parameters which influence the results were studied. These are: the effect of a) Na_2CO_3 - NaHCO_3 concentration, b) the concentration of uranium; c) particle size, d) linear velocity of flow. It is shown that the amount of uranium adsorbed was reduced by increasing the Na_2CO_3 - NaHCO_3 concentration, while the capacities remained constant. The saturation capacity decreased when the concentration of U was reduced and also with increasing particle size. The optimum linear velocity of flow was found to be approximately 8 m/hour. To study the elution an NH_4Cl - NaCl eluent was used, the flow velocity and column diameter being kept constant. The effects of various eluents were studied. It was shown that the addition of Na_2CO_3 to a NH_4Cl eluent increased the efficiency of desorption but caused an inflection on the elution curve. There are 12 figures and 14 tables. X

TITLE: Application of ion exchange resins in the extraction
of uranium. II. Investigating the properties of Mykion
PA resins in the recovery of uranium

PERIODICAL: Magyar kémiai folyóirat, ⁶⁸no. 6, 1962, 268 - 274

TEXT: Model experiments were carried out on the ageing of 2 types
of ion exchange resins. Mykion PA, synthesized at the Műanyagipari
Kutató Intézet Research Institute of the plastics Industry), and
Amberlite IRA-400 resins were subjected to several hundred cycles
of adsorption-washing-elution-washing. Changes of volume, particle
size, particle shape, and capacity were studied as functions of the
number of cycles. The experiments were made in an apparatus contain-
ing four resin beds. Each cycle lasted for 10 minutes, where the
two washing operations took up 2 minutes each and the adsorption
and elution 3 minutes each, 5 ml of the chloride form of the resin
was used, with particles between 0.32 - 0.63 mm. Experiments were
Card 1/2 X

Application of ion exchange resins ... H/005/62/000/006/002/002
D249/D307

made with a synthetic U feed solution and with leaching solutions. The synthetic feed solution contained approximately twice the amount of U needed to saturate the resin since the time of contact between the solution and the resin was not sufficient to achieve saturation. The eluent was 10 % NaCl containing 0.5 % Na₂CO₃. Amberlite IRA-400 and Mykion PA-V resins showed the best and most consistent mechanical properties. There are 4 figures and 7 tables.

4414. THE DYNAMICS OF GASTRIC SECRETION IN ULCER - Recherches sur la dynamique sécrétoire de l'estomac dans la maladie ulcéreuse - Fodor M. O. Ille Clin. Méd., Acad. Hatieganu, Cluj - ARCH. MAL. APPAR. DIG. 1958, 47/78 (815-844) Graphs 14 Tables 1

In duodenal ulcer there is a disturbance in the rhythm of HCl secretion. This dyssecretory state is marked by continued secretion of gastric juice containing free HCl, even without interdigestive or nocturnal pauses in secretion. Secretory dynamics in gastric ulcer are not marked by a continued secretion of free HCl. The secretory disturbance appears also during the pre-ulcerous phase of the illness; it is present in the active and in the quiescent phase of duodenal ulcer. Also the post-operative jejuno-ulcer presents the dyssecretory state; in patients after gastrectomy without an ulcerous relapse there are no signs of the above-mentioned secretory disturbance. The exploration of secretion may prove of use in the discovery of oligosymptomatic forms of duodenal ulcer and post-operative jejuno-peptic ulcer.

Gastric tubage was performed throughout 24 hr. No arrest of secretion of gastric
juices was found but there was on each occasion a drop in acidity values with the
exception of cases with duodenal ulcer. Chronic gastritis showed secretory dyna-
mics similar to those of ulcer disease. Kraus - Arad

EXPLORATION OF THE PHASES OF GASTRIC SECRETION - Cercetări asupra funcției secretorii a stomacului rezecat pentru boala ulceroasă. I. Contribuții la explorarea fazelor secreției gastrice - Fodor O., Popa M. and Tomoiogă T. Clin. Med. III, I.M.F., Cluj - STUD. CERCET. MED.(Cluj) 1958, 8/3-4 (419-427)
Graphs 4 Tables 1

Attempts were made to determine the 2 secretory phases of the resected stomach by application of suitable secretion-stimulating substances (caffeine, histamine, insulin-induced hypoglycaemia). The positive response to caffeine (stimulant for the 2nd, hormonal, phase) indicates the persistence of a gastrin-producing zone owing to insufficient extension of the resection to the right; a negative response,

6413

inversely, proves that the resection has been sufficiently extensive to eliminate the 2nd phase. A positive response to a humoral stimulant (histamine) demonstrates the presence of a remnant of gastric surface on the left which has a latent secretory capacity. The positive response to hypoglycaemia, through vagus stimulation, activates, in case of negative response to caffeine, this latent capacity, with a vagal secretion characteristic of the first phase. The capacity of HCl secretion consequently persists even in the absence of the antro-pyloric gastrin-producing region. It is to some extent possible for the 2 phases to manifest themselves independently. The disturbed secretory condition in ulcer disease expresses itself through the 2nd phase. When the continuous secretion of HCl persists, even if the resection has been sufficiently wide towards the right, it is possible that a jejuno-peptic ulcer will appear.

6414. STUDIES OF THE SECRETORY FUNCTION OF THE STOMACH AFTER RESECTION FOR ULCER DISEASE. II. GASTRIC SECRETION OF THE STOMACH IN CASE OF POSTOPERATIVE JEJUNO-PEPTIC ULCER - Cercetări asupra funcției secretorii a stomacului rezecat pentru boala ulceroasă. II. Dinamica secreției a stomacului în ulcerul jejuno-peptic postoperator - Fodor O. Clin. Med. III, I. M. F., Cluj-STUD. CERCET. MED. (Cluj) 1958, 5/3-4 (429-435) Graphs 4 Tables 1

A study was made of the HCl-secreting capacity of the stomach in postoperative jejuno-peptic ulcer. By applying suitable stimulants for the exploration of the 2 secretory phases it was found that in all cases of postoperative jejuno-peptic ulcer the secretory function of the stomach in its 2 main phases persists. Exploration of the fluctuations of the secretion over a period of 24 hr. revealed the same state of disturbed secretion that is characteristic of non-operated ulcer disease (duodenal ulcer); it persists also in postoperative jejuno-peptic ulcer. The disturbed secretory condition is characterized by continuous secretion of gastric juice containing permanently high levels of HCl, without any secretory pause during the 24 hr. The persistence of the secretory disturbance is probably due to the hormonal phase that has remained active.

EXCERPTA MEDICA Sec 6 Vol 13/3 Internal Med. Mar 59

1526. COMPLEX CLINICAL, HISTOPATHOLOGICAL AND ELECTROPHORETIC INVESTIGATION IN THE ESTIMATION OF THE EVOLUTION OF CHRONIC HEPATITIS - *Aprecierea evoluției hepatitei cronice prin cercetare complexă clinică, histopatologică și electroforetică* - Fodor O., Dorian V., Ban A. and Szantay I. *Clin. a III.-a Med. I.M.F., Cluj* - MED. INTERNA (București) 1958, 10/3 (351-360)

Examination of 34 cases of chronic hepatitis led to their classification into 3 de-

velopmental categories: stabilized chronic hepatitis, chronic hepatitis with slight evolution, and chronic hepatitis with pronounced evolution. A parallelism was observed between the histological aspect and the variations in the serum proteins, increase of the γ -globulins being proportional to the degree of tissue alteration, and with the hyperplasia of the Kupffer cells; in severe cases, the presence of cryoglobulins was noted. The α - and β -fractions did not present characteristic alterations. No quantitative limits in connection with the severity could be determined.

Title : Ariboflavinosis. Clinical Investigations.

Orig Pub : Med. interna, 1958, 10, No 6, 845-853

Abstract : In patients with expressed symptoms of ariboflavinosis (AR) and with endogenic insufficiency of riboflavin (R) accompanying, in a majority of cases, a basic disease (anemia, achlorhydria, gastrectomy), the connections between clinical manifestations of AR and R metabolism (with and without loading with R), as well as Fe content in blood and gastric secretion were studied. In majority of cases (16 of 18), a correspondence between clinical manifestations of AR and decreased spontaneous introduction of R was noted. The test with R loading, according

6773. THE MICROBIAL ALLERGIC COMPONENT IN GENERAL NEUROSIS ASSOCIATED WITH VEGETATIVE DISORDERS - Componenta alergică microbiană în nevroza generală cu tulburări vegetative - Hațieganu I., Fodor O., Maier N. and Vasilescu V. Clin. a III-a Med. I.M.F., Cluj - MED, INTERNA (Bucuresti) 1958, 10/8 (1133-1137)

In a study of the infectious-allergic component in the pathogenesis of general neurosis with digestive-autonomous phenomena, positive intradermal reactions have been obtained to the total antigen or to the haptene, and agglutination with patients' serum in 19 subjects in whom pathogenic germs could be isolated from the bile, the faeces or the urine. In view of the fact that in the majority of the cases the hepato-bilio-duodenal dyspeptic disturbances appeared before the neurotic phenomena, the question arises whether the presence - at a certain stage of the evolution - of these microbial agents does not bring about modification by a humoral, neuro-allergic mechanism, which play a part in the precipitation of the neurosis.

"Legal Regulation of Medical Secrecy."

Budapest, Orvosi Hetilap, Vol 104, No 35, 1.Sept 63, pages 1657-1663.

Abstract: [Author's Hungarian summary modified] The changes, in Hungary, in the legal regulations concerning the duty of secrecy of the physician are discussed in detail. The delicate balance between the right for secrecy of the patient and the interest of the community increases the extent of the problem. While legal regulations vary with time and location, the age-old duty of the physician is to keep silent. No references.
